

# CHICKEN SOUP

## To increase fluid intake

**A delicious soup with a fine chicken heart is a simple way to entice dogs and cats to take in fluids.**

The daily fluid requirement of dogs and cats is about 50 - 70 ml per kilo of body weight. With the daily meals (more with wet food, less with dry food) a part of the liquid requirement is already covered.

Sufficient (but not too much) fluid is especially important for the kidneys to perform their filtering function.

### **Preparation:**

Mix with warm water and allow to thicken for five minutes. For 6 grams of product (= approx. 2 heaped teaspoons) use approx. 100 ml of water.

### **Feeding recommendation:**

To increase the animal's fluid intake, feed as needed. Can be served individually as a soup or mixed in small quantities with the main diet.

### **Composition**

92% freeze-dried chicken hearts, organic guar gum, salt

### **Analytical components**

40% protein, 43% fat content, 1% crude fiber, 5% crude ash.

### **Product data**

Supplementary food for dogs and cats  
Can with 80g
